# How to Enable AWSVPC Trunking

https://medium.com/geekculture/mongodb-replica-set-in-aws-ecs-with-terraform-4621451c6190

1. Enter in the AWS Console.

2. Go to ECS (Elastic Container Service) and select the "Account Settings" option

3. Scroll down and select "AWSVPC Trunking":

Amazon ECS ENI Trunking allows you to increase the number of elastic network interfaces (ENIs) that can be attached to container instances that use specific Nitro instance families. For more information about the specific ENI density allowed for each instance type, see the documentation. Learn more

Select or deselect the check box below to enable or disable trunking. A change in setting applies to new instances launched after you change your setting.
